

EY Physical AI Engineering | Independent candidate materials

Russell Dudek

90-Day Entry Plan | EY Physical AI Engineering

Pittsburgh, Pennsylvania | 412.287.8640 | russelldudek@gmail.com linkedin.com/in/russelldudek | <https://russelldudek.github.io/EY/>

Operating premise

Earn trust through the work.

A 90-day plan for a technical consulting manager entering an established interdisciplinary practice.

00

Entry posture

This plan is a hypothesis for discovery. It does not presume undisclosed EY methods, team structure or client programs. Its purpose is to show how Russell would learn quickly, contribute credibly and make physical-AI delivery easier to operate.

First principle

Do not arrive with a replacement methodology. Read the system EY already has: technical standards, alliance capabilities, engagement mechanics, review authorities, reusable assets and the informal practices that make delivery work.

Success at day 90

Trusted by one delivery team and client workstream.

Clear boundary between Russell's credible technical contribution and specialist depth.

One useful workstream outcome or artifact delivered.

One evidence continuity improvement adopted without process burden.

One grounded opportunity for reusable capability or additional service.

90-day measures

Trust Team and client seek Russell's judgment on a defined workstream. Behavioral evidence

Delivery Commitments, dependencies and acceptance evidence remain visible. Workstream evidence

Technical growth Documented learning path across the exact platforms, robotics stack and review methods in use. Demonstrated contribution

Economics Rework, reuse and additional-service hypotheses are discussed with engagement leaders. Decision evidence

Russell Dudek

90-Day Entry Plan | EY Physical AI Engineering

Pittsburgh, Pennsylvania | 412.287.8640 | russelldudek@gmail.com linkedin.com/in/russelldudek | <https://russelldudek.github.io/EY/>

Days 0-30

Read the system

Learn the technical, client and commercial operating environment before prescribing.

30

Technical immersion

Map the actual robotics, simulation, data, MLOps, DevOps and cloud toolchain used by the team.

Review representative architecture, test, deployment, safety and handoff artifacts.

Pair with deeper specialists in ROS, Omniverse/Isaac, controls, perception and ML workflows.

Build a precise learning backlog tied to active work rather than generic certification.

Engagement immersion

Shadow daily client sessions and internal delivery rituals.

Understand the engagement economics, scope boundaries and expansion logic.

Map decision rights across EY, alliance partners and the client.

Identify recurring seams where technical evidence becomes hard for clients to act on.

Deliverables by day 30

Deliverable

Purpose

Acceptance evidence

Capability and authority map

Clarify who owns which technical and operating decisions.

Reviewed by workstream lead and specialists.

Learning-through-delivery backlog

Focus skill acquisition on work that matters now.

Named pairing opportunities and contribution targets.

Engagement decision map

Connect client outcome, scope, dependencies, economics and risk.

Used in one planning or review conversation.

Bounded contribution charter

Define one area Russell can own without overstating technical depth.

Clear owner, output, interfaces and evidence.

Risks to avoid

Over-indexing on management language; creating parallel process; claiming stack depth not yet demonstrated; translating client complexity into an oversimplified dashboard; waiting too long to produce useful work.

EY Physical AI Engineering | Independent candidate materials

Russell Dudek

90-Day Entry Plan | EY Physical AI Engineering

Pittsburgh, Pennsylvania | 412.287.8640 | russelldudek@gmail.com linkedin.com/in/russelldudek | <https://russelldudek.github.io/EY/>

Days 31-60

Lead a bounded seam

Contribute directly while making the workstream easier to understand and operate.

60

Own defined work

Lead a bounded integration, test, evidence, operating-readiness or client-handoff seam.

Maintain commitments, dependencies, decisions and acceptance evidence.

Use specialist review explicitly; do not substitute generalist confidence for technical proof.

Translate technical findings into client consequences without stripping nuance.

Introduce only useful mechanism

Prototype the Reality Transfer Case beside existing artifacts.

Test whether it reduces ambiguity across mission, environment, perception, authority, run state and learning.

Remove fields that do not change decisions.

Keep essential engineering evidence in its native systems.

Manager operating cadence

Daily Blockers, evidence changes, client decisions and specialist dependencies. Workstream clarity

Weekly Scope, quality, risk, utilization, margin and next-client decision. Engagement health

At each gate Mission, coverage, uncertainty, authority, run-state and ownership evidence. Proceed / rehearse / bound / hold

After each event What the twin, runbook, test suite and client understanding must learn. Reusable improvement

Deliverables by day 60

One bounded workstream outcome with traceable acceptance evidence.

One client-readable decision brief grounded in specialist evidence.

One tested Reality Transfer Case prototype with clear keep/remove feedback.

One coaching or knowledge-sharing session that improves team decision quality.

EY Physical AI Engineering | Independent candidate materials

Russell Dudek

90-Day Entry Plan | EY Physical AI Engineering

Pittsburgh, Pennsylvania | 412.287.8640 | russelldudek@gmail.com linkedin.com/in/russelldudek |
<https://russelldudek.github.io/EY/>

Days 61-90

Transfer and compound

Close the loop with the client, the team and the practice.

90

Transfer operating ownership

Confirm client or support ownership, authority, observability, incident and improvement responsibilities.

Make unresolved assumptions and residual risks explicit.

Verify that the handoff is usable in the client's actual cadence.

Capture what should trigger rollback, retraining, re-simulation or human-first operation.

Harvest practice leverage

Separate reusable engineering or delivery patterns from client-specific content.

Quantify delivery effort and rework categories where evidence exists.

Identify alliance, accelerators or capability gaps that matter repeatedly.

Frame additional services only where the current work proves a real need.

Day-90 review

Question

Evidence sought

Resulting decision

Did Russell improve delivery?

Workstream completion, reduced ambiguity, clear acceptance and client feedback.

Expand or narrow ownership.

Did technical credibility grow?

Specialist-reviewed contributions and demonstrated stack learning.

Next technical development targets.

Did the mechanism help?

Fewer late surprises, clearer authority or better client decisions.

Reuse, revise or retire it.

Is there repeatable leverage?

Patterns across engagements, rework categories, reusable evidence or assets.

Invest, partner, standardize or stop.

Is there grounded growth?

Client need, outcome evidence and delivery feasibility.

Propose next service or capability.

90-day proposition

Russell should earn broader scope only after proving he can help a specialist team and client move one physical-AI workstream from technical possibility toward trustworthy operation.

Independent candidate plan. All EY-specific operating details remain hypotheses for discovery.
